TOPIC TAGS: sheet metal, metal cutting, cutting tool/ D16ATN alloy, V95ATN alloy, V95ATV alloy

ABSTRACT: Sheets of heat-treated light alloys of the type D16ATN, V95ATN, and V95ATV, with σ_b = 50 kg/mm^2, is cut with machines of three types: 1) with a stationary spindle directed vertically upward; 2) with a spindle directed vertically downward, capable of being displaced in the horizontal plane along a template with the aid of a hinged pointer; 3) profiling milling machines with mechanical feed. The first two types of machines have a manual feed. The cut stack can have a thickness up to 10 mm and can consist of 1 - 6 sheets. The conditions for group cutting of sheet material are recommended. The optimal geometry of two-tongued milling cutters is given. The rear angle should be not larger than 25°. The width of the chamfer of the rear angle should be 0.5 - 0.7 mm. A cylindrical chamfer not larger than 0.02 mm is permissible on the cutting blade. The cutting part of two-tongued milling cutters is made of R18 steel and has a hardness HRC 58 - 60. The tail piece is of 45 steel with hardness HRC 40.

Akademiya nauk SSSR. Komissiya po tekhnologii mashinostroyeniya

Obrabotka zharoprochnykh splavov (Treatment of Heat-Resistant Alloys) Moscow, Izd-vo AN SSSR, 1960. 251 p. 3,500 copies printed.

Sponsoring Agency: Akademiya nauk SSSR. Komissiya nauki po problemam zharoprochnykh splavov.

Ed.: V.I. Dimidik, Candidate of Technical Sciences; Ed. of Publishing House: V.A. Kokorev; Tech. Ed.: V.V. Bolgarl.

PURPOSE: This collection of papers is intended to summarize current information on the treatment of heat-resistant alloys with a view toward coordination for...

CONTENTS: The book is a collection of papers presented at the Conference on Heat-Resistant Alloys, held 15-21 December 1957 by the Commission on Machine-Construction Technology of the Institute mashinovedeniya AN SSSR (Institute of Machine Science, Academy of Sciences USSR). The thirty papers in the collection deal with the cutting, pressure working, welding, and cutting of heat-resistant alloys. No personalities are mentioned. References accompany most of the articles.

Soveshchaniye po obrabotke zharoprochnykh splavov, Moscow, 1957.

Obrabotka zharoprochnykh splavov; [sbornik dokladov...] (Treatment of Heat-Resistant Alloys; Collection of Papers Read at the Conference), Moscow, Izd-vo AN SSSR, 1960. 231 p. 3,500 copies printed.

Sponsoring Agencies: Akademiya nauk SSSR. Institut mashinovedeniya. Komissiya po tekhnologii mashinostroyeniya; Akademiya nauk SSSR. Institut metallurgii im. A.A. Baykova. Mashiny sovet po problemam zharoprochnykh splavov.

Resp. Ed.: V.I. Dikushin, Academician; Ed. of Publishing House: V.A. Kotov; Tech. Ed.: V.V. Brugul'.

PURPOSE: This book is intended for metallurgists.

COVERAGE: The book consists of thirty papers read at the Conference on the Treatment of Heat-Resistant Alloys held in Moscow by the Committee on Machine-Building Technology, Institute of the Science of Machines, Academy of Sciences, USSR, in 1957. The papers deal with four principal areas of all metallurgy: casting, forming, machining, and welding. The alloys (together with refractory carbides, borides, nitrids, and oxides) are discussed especially in connection with their application in the manufacture of turbine blades, heat engines, boilers, reactors, containers for high-temperature media, dies, casting molds, and metal-cutting tools. No personalities are mentioned. Some of the articles are accompanied by references, mainly Soviet.

TITLE: Speed Milling of the Hardened ZOKhGSNA Steel

PERIODICAL: "Tr. Kuybyshevsk. aviats. in-t", 1959, No. 9, pp. 81-87

TEXT: An investigation showed that the application of speed milling of the hardened 30ХГСНА (ZOKhGSNA) steel with two-sided cutting disks and cylindric instead of grinding is quite possible with obtaining precision of the third class and a finish of the classes 6-7. The optimum geometric characteristics of these cutters are: $\gamma = -10^{\circ}$, $\alpha = 15^{\circ}$, feeds of the cutting disks are 0.02 - 0.07 mm per tooth, for cylindric cutters 0.05 - 0.15 mm per tooth; cutting speed for cutting disks 75 - 150 m/min, for cylindric ones 40-75 m/min. The change in the size in consequence of the wear of the cutting disks was compensated by their axial displacement by a special device. - There are 5 figures.

TITLE: The Voronezh Reservation (Voronezhskiy zapovednik)

PERIODICAL: Priroda, 1958, Nr 9, pp 61-67 (USSR)

ABSTRACT: The Voronezh Reservation was developed from a beaver reservation established in 1922. In 1934, the area was expanded to a general reservation of 31,000 hectars. The beaver population of the reservation developed from 70 river beavers (Castor fiber L.) in 1923 to about 400 in 1934. Over the Soviet Union, there are now about 10,000 beavers which were reared in the Voronezh Reservation. L.S. Lavrov has summarized the practical work of the reservation and has written a directive on the capture and transportation of beavers. Zootechnical investigations and veterinary-parasitological studies are made at the reservation. The Leningradskiy veterinarnyy institut (Leningrad Veterinary Institute) developed successful vaccines against the paratyphoid fever of the beavers. In 1955, research on the chemical composition of natural beaver food was started. In 1957 a biochemical laboratory was opened with the assistance of the correspondent member of VASKhNIL Professor V.V. Koval'skiy, to analyze the nutritive, mineral

Card 1/2

and micro elements in the natural food of river beavers. The European deer (Cervus elaphus L.) is also studied in the Voronezh Reservation. Their number increased from about 30 in 1922 to 580 in 1952. P.A. Merts studied the ecology of the deer in 1951 and 1957. In 1950 wild boar and in 1952 elk appeared in the Reservation. Pine forest areas increased by 24% between 1937 and 1954. The Moskovskiy gosudarstvennyy universitet (Moscow State University) - Chair of Soil Science - is studying the entire biological circle of the nutritive elements in the forests of the reservation (Usmanskiy Bor) under the direction of Professor N.P. Remezov. The reservation has 8,000 to 10,000 annual visitors and many special installations, among them a large library and a natural museum. Students and researchers from Moscow, Leningrad, Voronezh and other large cities frequently work here. The reservation administration publishes an annual periodical called "Letopici prirody". There are 4 photos.

TITLE: An Ultrasonic Recording Flaw Detector for Metal Sheets (Ul'trazvukovaya ustanovka s zapis'yu izobrazheniy defektov v metallicheskikh listakh)

PERIODICAL: Akusticheskiy zhurnal, 1959, Vol 5, Nr 3, pp 364-366 (USSR)

ABSTRACT: The paper describes an ultrasonic flaw detector for quality control in rolling of sheets, developed at the Leningrad Electro-Technical Institute imeni V.I. Ul'yanov (Lenin). The detector (shown schematically in Fig 1) works on the shadow principle. The sheet KL, whose quality is controlled passes in water between an array of radiating vibrators IV and an array of receiving vibrators PV. Fig 1 shows for the sake of simplicity only nine pairs of vibrators; in the actual detector their number is considerably greater. Ultrasonic oscillators G, working at 1.3 Mc/s, feed certain groups of radiators. The receivers are also grouped and their signals are fed to amplifiers U. The image of the defect is recorded on heat-sensitive paper by means of a recorder ZU. The radiators are switched on consecutively by means of a synchronizer S which produces in this way an ultrasonic beam passing 50 times per second across the continuously moving metal sheet. If the beam meets a defect in the sheet a signal is produced at the output amplifying stage. A resolving device RU

Card 1/2

An Ultrasonic Recording Flaw Detector for Metal Sheets

(circuit in Fig 2) determines which pair or pairs of the vibrators are responsible for the signal (e.g. pairs 5, 6 and 7 in Fig 1). At the recording stage traces are produced which show the location and the extent of the flaw, as shown in Fig 3. The latter figure represents a pattern produced by a cleavage in a 40 mm thick metal sheet recorded by a detector with 64 vibrator pairs. The detector can be used to control the quality of sheets with comparatively rough surfaces immediately after rolling. The principle of the detector is in fact a new method of ultrasonic visualization and could, therefore, be used for purposes other than factory quality control. There are 3 figures.

TITLE: Excitation of normal waves in plates by the method of an obliquely incident sound beam

SOURCE: Akusticheskiy zhurnal, v. 10, no. 1, 1964, 48-53

TOPIC TAGS: excitation, normal wave, sound beam, wave field, piston radiator, defect detection, wave propagation, plane wave, Fourier transform, Bessel function

ABSTRACT: The authors compute the wave field formed in a plate by impinging on it a sound beam created by a piston radiator. They obtain asymptotic formulas determining the direction of the normal waves and the dependence of their amplitude on the angle of inclination of the radiator. The computational results are experimentally verified. This problem is of interest in defect detection. Orig. art. has: 3 figures and 16 formulas.

AUTHORS: Verevkin, V. M., Zharkov, K. V.

TITLE: Ultrasonic Immersion-crack Automatic Detector (Ul'trazvukovoy immersionnyy defektoskop-avtomat)

PERIODICAL: Zavodskaya Laboratoriya, 1959, Vol 25, Nr 4, pp 475-477 (USSR)

ABSTRACT: An automatic device for sorting out defective piston rings was designed. It consists of the crack detector and the sorting mechanism (Fig 1) with a relay scheme. With corresponding modifications, the sorting mechanism of the described device can also be used for testing other articles. The defective object passes a test course with 4 stages while the test of faultless products is interrupted at the third stage. The working principle of the device is as follows: The object to be tested is received by a device in form of a Maltese cross (1st stage), is held by an electromagnet on a control table and tested by the piezoelectric vibrator of the crack detector by means of ultrasonic impulses (2nd stage). In the 3rd stage, the cross is turned with the sample to an opening in which the faultless articles drop. If the object has a fault, the ultrasonic impulse is reflected; this operates an electromagnet above the opening which holds the object and makes it go to the next

Card 1/2

Ultrasonic Immersion-crack Automatic Detector

opening for defective products. A schematic sketch of the arrangement of the device is given (Fig 2). It is mentioned as a peculiarity that the so-called "immersion method" is applied, i.e. a liquid layer, between the vibrator and the article to be tested, which secures a constant acoustic contact and facilitates the exchange of the articles. On metallic objects with a coarse-grained structure and rough-machined surfaces, defects of about 0.1 mm^2 can be observed. The X-ray picture of two piston rings (Fig 3a) and of an impulse of the control beam tube (Fig 3b) are given as examples; the existing defects can be better observed in the latter. There are 3 figures.

The activity of the enzymes of hemolyzed and non-hemolyzed erythrocytes. II. The activity of peroxidase. A. A. Kul'tyugin and M. V. Zhatkov. Izvest. sci. inst. (U. S. S. R.) 50, No. 1-2, 115-20 (1938). The activity of peroxidase (I) was detd. in hemolyzed (II) and non-hemolyzed (III) erythrocytes of rabbit blood by the addn. of isotonic solns. of glucose, 1% H_2O_2, and guaiacol (IV). After a period of time the oxidized IV was detd. colorimetrically. The activity of I in III was 33-72% less than that in II. $NaNO_3$ in concns. of 0.001-0.1 *N* increases the activity of I slightly, while *N* solns. have a slight inhibitory action. With catalase, $NaNO_3$ causes the activity to drop sharply, in some cases to 0. The activity of I in III was 43-57% that of I in II in the presence of isotonic $NaNO_3$, and 38.3-44.2% in the presence of isotonic solns. of the nitrates of Na, K, Ca and Mg. S. A. Karjala

TITLE: Method for obtaining film-forming materials and impregnating materials for trimming and filling of natural and artificial leather. Class 39, No. 175227

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 19, 1965, 70

TOPIC TAGS: leather, polymer, protein, vinyl plastic, acrylic plastic

ABSTRACT: This Author Certificate presents a method for obtaining film-forming and impregnating materials for trimming and filling of natural and artificial leather by modification of vinyl, for instance, acrylic and methacrylic monomers by means of proteins. To increase the thermal, acetone, and water stability of coatings and the durability and filling of the material structure, the starting monomers are emulsified in an aqueous protein solution. The emulsification is followed by

TITLE: A Method of Accelerating the Hardening of Cementing on Porcelain Insulators (Sposob uskorennogo otverzhdeniya tsementnykh svyazok farforovykh izolyatorov)

PERIODICAL: Vestnik Elektropromyshlennosti, 1958, Vol.29, No.3, pp. 64 - 66 (USSR)

ABSTRACT: Metal fittings are applied to porcelain insulators with Portland cement. The main disadvantages of this procedure is the long time required for the cement to harden. It is usually considered that insulators can be tested and transported on the 3rd or 4th day after cementing. The actual strength of the cementing in compression may be greater than might appear from the results of tests on standard cubes and the strength of cement test pieces depends very greatly on the ratio of the height to the area of the specimens. Table 1 gives the results of compression tests on cement specimens with various values of this ratio. Mechanical tests on insulators show that if the cement is good and the fitting correctly applied, the cement very rarely breaks - it is usually the porcelain that breaks. Therefore, it is not necessary to make the cement very strong. The All-Union Electro-technical Institute has found a way of

Cardl/3 hardening cement in high-voltage porcelain insulators which

A Method of Accelerating the Hardening of Cementing on Porcelain Insulators.

gives in four or five hours a strength that normally takes several days to acquire. Test specimens were made up with a minimum quantity of water, using calcium chloride as an accelerator, and hardened in an oven at 100 °C. No cracking was observed in 1 000 specimens. It was found best not to raise the temperature of the specimens too quickly. After four hours hardening under thermostatic control the cement had 60 - 70% of the strength in compression of a sample hardened for a month under water. If the cement is left longer in the oven, the strength increases up to a period of 12 hours, as will be seen from Table 2. Samples hardened in the oven strengthen normally on storage in air. Tests results that confirm this are given in Table 3.
Samples hardened in the thermostat were subjected to temperature cycling from 125 - 20 °C. Small cracks began to appear after 12 cycles but the results given in Table 4 show that they had not much influence on the strength. A study was made of the change in shape of cementing during accelerated hardening, with the results shown in Table 5. Gypsum and sulphuric acid additives noticeably increase the swelling of samples hardened in water. Similar additions have no influence on the swelling

A Method of Accelerating the Hardening of Cementing on Porcelain Insulators

after accelerated hardening. By vibrating the sample with additives the swelling after oven-hardening is much reduced. The accelerated method of hardening cement joints was applied to the manufacture of post-insulators, type OA-6. After four hours in the oven and cooling for an hour, the insulators were ready for test. Bending tests gave the results seen in Fig. 6 and indicate that insulators made in this way are quite as strong as those made by prolonged hardening under water. In all cases, it was the porcelain that broke; equally successful tests were made on other types of insulators. Table 7 gives an idea of test results on string-type insulators after accelerated hardening. The insulators were quite up to standard. The use of calcium chloride or sulphuric acid does not cause corrosion of the metal fittings. The acid is completely neutralised by alkali that is formed during the reaction between cement and water.
There are 7 figures.

TITLE: Modernizing 1GD-9 and 2GD-3 Dynamic Speakers

PERIODICAL: Za industr. Ryazan'. Byul. tekhn.-ekon. inform., 1958, Nr 4, pp 26-27

ABSTRACT: The design of the diffuser holder and fastening of contact lugs of the 1GD-9 speaker have been altered. The new design has 2-3 times as much cone-shape (?). The old diffuser holder design required 9 manufacturing operations, the new design, 6. Labor productivity increased 1.6 times. The lugs were fastened by means of aluminum rivets; in the new design, each lug is fastened directly to the shock absorber and does not require complicated devices. Lead solders are shifted off the moving system which is more convenient for assembling. Lead length was cut by 15 mm in the 1GD-9 speaker and by 20 mm in the 2GD-3 speaker which resulted in a saving on ATSDI wire of 42,000 rubles' worth per year. The total annual saving from modernization is 766,000 rubles.
